This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights :

- VR techniques more easily highlight attentional difficulties in MS than usual tests
- MS patients exhibit greater difficulty in maintaining driving trajectory than controls,
- Patients make more errors during driving under divided-attention condition
- Driving preventive measures must be encouraged by health-care providers
