This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Journal of Structural Biology – Paper of the Year 2017

This year we had many meritorious papers. In the event, the award is being shared by:

(i) Yoshiyuki Fukuda from the Molecular Structural Biology Department of the Max Planck Institute for Biochemistry, Martinsried, Germany, for the paper

Electron cryotomography of vitrified cells with a Volta phase plate

Yoshiyuki Fukuda, Ulrike Laugks, Vladan Lučić, Wolfgang Baumeister and Radostin Danev; Vol. 190, Issue 2, Pages 143-154; May 2015; and

(ii) Kai Zhang from the MRC Laboratory of Molecular Biology in Cambridge U.K. for the paper

Gctf: Real-time CTF Determination and Correction

by Kai Zhang; Vol. 193, pp 1- 12, January 2016.

Dr Fukuda was mentored by Dr Radostin Danev. Dr Zhang was hosted and received editorial guidance from Dr Andrew Carter. Drs Fukuda and Danev will both be taking up faculty appointments at the University of Tokyo in Jaon early in 2018.

We congratulate the winners on their fine work. More information on the context of the respective studies is given below.

Andrei N. Lupas and Alasdair C. Steven (Editors-in-Chief)

(i) Yoshiyuki Fukuda started his electron cryo-microscopy career during his Ph.D. studies in the laboratory of Prof. Kuniaki Nagayama at the National Institute for Physiological Sciences, Okazaki, Japan. He worked on applications of Zernike-type phase plates to electron cryotomography (cryo-ET) of vitrified cultured cells and vitreous sections from frozen tissues. Yoshiyuki analyzed the effects of the phase plate hole size on the presence and severity of phase contrast fringing artifacts in the images. His early work demonstrated the practical benefits of using phase plates for cellular cryo-ET in terms of improved contrast and enhanced visibility of morphological features.
