This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights:

- A two-generation family study was performed to find endophenotypes of social anxiety.
- Heart rate variability did not co-segregate with social anxiety within families.
- RMSSD during the first resting state and high frequency power were heritable.
- Heart rate variability is a possible endophenotype, but not of social anxiety.
