This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights:

- Religiosity positively correlated with age and negatively correlated with depressive symptoms.
- Age serves as a moderator in the relation between religiosity and depressive symptoms for both middle-aged and younger adults.
- High levels of religiosity were related to lower levels of depression in middle-aged and younger adults.
