

# Structured Reporting in Radiology

Dhakshinamoorthy Ganeshan, MD, Phuong-Anh Thi Duong, MD, Linda Probyn, MD, Leon Lenchik, MD, Tatum A. McArthur, MD, Michele Retrouvey, MD, Emily H. Ghobadi, MD, Stephane L. Desouches, DO, David Pastel, MD, Isaac R. Francis, MBBS

Radiology reports are vital for patient care as referring physicians depend upon them for deciding appropriate patient management. Traditional narrative reports are associated with excessive variability in the language, length, and style, which can minimize report clarity and make it difficult for referring clinicians to identify key information needed for patient care. Structured reporting has been advocated as a potential solution for improving the quality of radiology reports. The Association of University Radiologists—Radiology Research Alliance Structured Reporting Task Force convened to explore the current and future role of structured reporting in radiology and summarized its finding in this article. We review the advantages and disadvantages of structured radiology reports and discuss the current prevailing sentiments among radiologists regarding structured reports. We also discuss the obstacles to the use of structured reports and highlight ways to overcome some of those challenges. We also discuss the future directions in radiology reporting in the era of personalized medicine.

**Key Words:** Radiology; structured reports; patient care; research; patient-centered radiology.

## INTRODUCTION

The radiology report is vital for patient management. Radiologists play a major role in patient care by the accurate interpretation of imaging studies and appropriate communication of imaging findings to referring physicians. Although some referring clinicians may interpret imaging studies by themselves, radiologists' reports have been shown to be more accurate and comprehensive, resulting in improved patient care (1–5). To improve patient care, it is

imperative for the reports to be timely and accurate and to answer the clinical question. For a health-care system, these may be the most important, readily available metrics by which the value of radiology service could be measured.

Although learning how to report imaging studies is an essential component of radiology residency training programs, formal training on how to frame a radiology report often receives less than 1 hour/year (6). Instead, most trainees learn the art of reporting by observing faculty, senior residents, fellows, and peers.

Traditionally, radiology reports were created using free-text, narrative language. Studies show that the use of nonstructured reports using narrative language may serve as an obstacle to optimal patient care. Excessive variability in language, length, and style can minimize report clarity, making it difficult for referring physicians to identify key information needed for patient care (7–10).

Structured reporting has been advocated as a potential solution for improving the quality of radiology reports. A tiered approach to structured reporting has been described (7,11–13). At its basic level, a structured report should be organized with headings, such as clinical history, indication, technique, findings, and impression (Fig 1). The next tier of structured reports is where the “findings” section is organized with subheadings, such as the various organs (or anatomic structures) imaged (Fig 2). At the highest tier, the structured radiology report has all of the previously mentioned characteristics and uses a standardized language based on a universally accepted lexicon (Fig 3). Increasingly, academic centers are using structured radiology reports containing templates, macros, or prepopulated checklists.

The Association of University Radiologists—Radiology Research Alliance convened a task force to review the current status of structured reports in radiology. In the present article,

**FULL RESULT:****Examination:** CT chest abdomen and pelvis**Clinical History:** Renal cell carcinoma**Indication:** Restaging**Comparison:** None**Technique:** CT chest abdomen and pelvis with intravenous contrast and oral contrast.**Findings:** [Free Text]**Impression:** [Free Text]

**Figure 1.** Example of a radiology report using basic headings. CT, computed tomography.

we review the evidence supporting the use of structured radiology reports, and discuss its pros and cons and the current prevailing sentiments among radiologists regarding structured reports. We describe some ways to overcome challenges and successfully implement structured reporting in daily practice

**Examination:** CT chest abdomen and pelvis**Clinical History:** Renal cell carcinoma**Indication:** Restaging**Comparison:** None**Technique:** CT chest abdomen and pelvis with intravenous contrast and oral contrast.**Findings:****Chest**

Lung and large airways: [No suspicious pulmonary nodules]

Pleura: [No pleural masses. No pleural effusion]

Vessels: [Normal appearances of the thoracic aorta and its branches. Normal appearances of the superior vena cava]

Heart: [No cardiomegaly or pericardial effusion]

Lymph Nodes: [No thoracic adenopathy]

**Abdomen**

Liver: [Normal]

Bile ducts: [Normal]

Gallbladder: [Normal]

Pancreas: [Normal]

Spleen: [Normal]

Adrenals: [Normal]

Kidneys: [Status post right nephrectomy. No recurrence in the right nephrectomy bed.

Normal left kidney.]

Lymph nodes: [No abdominal adenopathy]

**Pelvis**

Reproductive organs: [Normal appearances of the uterus and ovaries]

Bladder: [No filling defects in the bladder]

Bowel: [No bowel wall thickening. No dilated bowel loops]

Lymph nodes: [No pelvic adenopathy]

Peritoneum: [Normal]

Vessels: [Normal appearances of the renal vessels, inferior vena cava, abdominal aorta and its branches]

Retroperitoneum: [Normal]

**Other**

Abdominal wall: [No abdominal wall masses]

Chest wall: [No chest wall masses]

Bones: [No suspicious osseous lesions]

**Impression**

[Status post right nephrectomy. No evidence of recurrence in the surgical bed. No metastasis in the chest, abdomen or pelvis]

and discuss the future of radiology reports in the modern era of precision medicine.

**ADVANTAGES OF STRUCTURED REPORTING**

A review of literature shows that structured reports have many advantages for radiologists as well as referring physicians (Table 1). Both radiologists and referring clinicians are interested in reducing the rate of diagnostic errors, which for radiologist accounts for as much as 4% of reports (14–18). One of the most common causes for malpractice lawsuits against radiologists is a missed diagnosis (19–22).

Although diagnostic errors in radiology are multifactorial, an important contributing factor is cognitive bias, arising from the radiologist's "satisfaction of search" (23). This error occurs when a radiologist prematurely stops "searching" for diagnoses, after making the initial diagnosis, based on clinical history. Using a checklist and a systematic search pattern may help to avoid such diagnostic errors (24–27). In a retrospective review of 3000 lumbar spine magnetic resonance imaging (MRI)
