11 **ABSTRACT:** A size-segregated gas/particle partitioning coefficient K_{Pi} was
12 proposed and evaluated in the predicting models on the basis of atmospheric
13 polybrominated diphenyl ether (PBDE) field data comparing with the bulk coefficient K_P .
14 Results revealed that the characteristics of atmospheric PBDEs in southeast Shanghai
15 rural area were generally consistent with previous investigations, suggesting that this
16 investigation was representative to the present pollution status of atmospheric PBDEs. K_{Pi}
17 was generally greater than bulk K_P , indicating an overestimate of TSP (the mass
18 concentration of total suspended particles) in the expression of bulk K_P . In predicting
19 models, K_{Pi} led to a significant shift in regression lines as compared to K_P , thus it should
20 be more cautious to investigate sorption mechanisms using the regression lines. The
21 differences between the performances of K_{Pi} and K_P were helpful to explain some
22 phenomenon in predicting investigations, such as P_L^o and K_{OA} models overestimate the
