This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights:

- Epidemic SIS model is studied on metapopulation networks with several nodes
- We analytically and numerically obtain the solutions of basic equations
- We find the infection density at hub is much higher compared to the other nodes
- However, the epidemic threshold and infection risk are unchanged for any node
