Unraveling within-host signatures of dengue infection at the population level

Ryan Nikin-Beers, Julie C Blackwood, Lauren M Childs, Stanca M Ciupe

PII: S0022-5193(18)30118-8
DOI: [10.1016/j.jtbi.2018.03.004](https://doi.org/10.1016/j.jtbi.2018.03.004)
Reference: YJTBI 9381

To appear in: *Journal of Theoretical Biology*

Received date: 4 October 2017
Revised date: 23 February 2018
Accepted date: 5 March 2018

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A multi-scale immuno-epidemiological model of dengue infection is proposed.
- An analytical threshold under which infections persist in the population is determined.
- A full numerical scheme for a two-strain immuno-epidemiological model is developed.
- Effects of within-host disease severity on population persistence are addressed.
