This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

## HIGHLIGHTS

Analytical modelling techniques are proposed to speed up transmission loss calculations in exhaust devices incorporating monoliths.

Multidimensional sound propagation in the expansion and contraction regions is combined with one-dimensional waves in the monolith capillary ducts.

The performance of the point collocation technique and the mode matching method is compared in terms of computational effort and accuracy.
