This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Immediate stimulus repetition abolishes stimulus expectation and surprise effects in fast periodic visual oddball designs

Highlights

- We studied visual mismatch responses with a fast periodic oddball design
- Our design cleanly separates immediate stimulus repetition and expectation effects
