This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights of the study:

- Predictive equations to estimate height and weight in children were developed
- We analyze the covariates that improve the predictive capacity of the equations
- We found a strong consistency between the observed and the predicted values
- The equations cover a wide range of age and are simple to use in the clinical use
