This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights for

- We studied the effects of childhood maltreatment (CM) and impulsivity on violence
- Outcomes were suicide attempt (SA), self-injury (SI) & interpersonal violence (IPV)
- CM had a stronger, positive effect on SA and SI than on IPV
- Impulsivity had a stronger effect on SI than on other types of violence in men
- Sexual abuse also had an effect on violence towards self in both genders
