This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A new micro-macro dynamic compressive-shear fracture model under static confining pressure is proposed.
- A novel critical strain rate making the dynamic crack initiation stress equal dynamic compressive strength is found.
- Effects of strain rate on dynamic shear strength, cohesion and internal friction angle are studied.
