Highlights

- F. spiralis is a good dietary source of iodine
- This seaweed presented low Cd, Pb, and Hg levels
- Essential and contaminant elements displayed high bioaccessibility percentages

Abstract

Fucus spiralis is an edible brown seaweed (SW) found in the Portuguese Coast that is still undervalued and not very well studied. However, SW are known to be nutritious and healthy foods, in part, for their potential to supply mineral nutrients to the body. Nevertheless, with the increasing levels of pollution in the coastal areas, SW can also accumulate some contaminants.
