This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A combined strategy of random forest and BP network proposed for spectrometrics.
- BP network trained with RF produced a renewal informative-plus-net variable group.
- The number of trees and splitting variables were tunable by $\Delta Gini$ in random forest.
- The number of hidden nodes in BP network was tunable by the minimum output error.
- The renewal variable group was verified performing significantly in applications.
