This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A novel zero-shot learning method is developed to rectify the hubness and domain shift problem.
- The proposed method exploits the class level visual samples to learn the projection function.
- The unseen visual prototypes are modified by the label correlations and their knns.
- The proposed method outperforms existing methods on 5 zero-shot learning datasets.
