This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

- We derive the 3D isogeometric model of the melanoma growth.
- We model tumor cell density, extracellular matrix, oxygen, tumor angiogenic factor.
- We couple continuous model with discrete vasculature growth model, that provides oxygen to the system.
- We apply fast isogeometric L2 projection solver implementing alternative direction implicit method for solution of the tumor growth model.
- We parallelize the simulation using GALOIS framework
