Title: Improvement of silicon carbide fibers mechanical properties by Cl₂ etching

Authors: Stéphane Mazerat, Adrien Delcamp, René Pailler, Jacques Lamon, Hervé Plaisantin

PII: S0955-2219(18)30388-1
DOI: <https://doi.org/10.1016/j.jeurceramsoc.2018.06.026>
Reference: JECS 11947

To appear in: *Journal of the European Ceramic Society*

Received date: 2-3-2018
Revised date: 9-6-2018
Accepted date: 14-6-2018

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Chlorination-etching process of SiCO fibers is found to improve tensile strength (up to 4000 MPa) and lifetime under static fatigue condition (gain factor up to 40), explained by surface-located flaw depletion.

Improvement of silicon carbide fibers mechanical properties by Cl₂ etching
