This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- HIT/HIE scores were developed to determine HIT/HIE penetration in the U.S. healthcare system.
- institutions with the highest HIT scores for specific measures showed modest improvement in 30 day readmissions, yet no improvement in length of stay.
- HIT/HIE participation may improve health outcomes through enhanced patient care coordination.
