**Abstract**

**Background.** Low-grade appendiceal mucinous neoplasms (LAMN) are poorly understood lesions characterized by their potential to spread to the peritoneal cavity as pseudomyxoma peritonei (PMP). The purpose of this study was to investigate the clinical and pathologic features and management of these tumors.

**Methods.** This was a retrospective study of consecutive patients with LAMN who underwent surgery by a surgical team at the First Affiliated Hospital of China Medical University between 2005 and 2016. Subgroup analyses were performed for patients with PMP.
