This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights:

- Children of mothers with postnatal depressive symptoms or depression had an increased risk of death in the first year of life.
- Children of mothers with prenatal and postnatal depressive symptoms or depression had a higher risk of hospitalization than those whose mothers did not have the disorder during prenatal and/or postnatal periods.
- As a limitation, different instrument and cut points were used to evaluate maternal depressive symptoms or depression.
- Other limitation one study do not clearly explain the dichotomization process of exposure since the authors used the ICD-9-CM codes.
