This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Research highlights

- The associations between maternal anxiety symptom during pre- and postnatal periods and 8-months old infants' attention disengagement from faces, particularly from threat, was assessed with eye-tracking.
- Maternal prenatal but not postnatal anxiety symptoms associated with heightened threat bias in infants.
- Maternal postnatal anxiety symptoms associated with overall probability of disengagement from faces to distractors differently for boys and girls..
- Long-term implications of these findings remain to be explored.
