This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Application of human induced pluripotent stem cells for modeling and treating neurodegenerative diseases

Highlights

- We review the use of iPSC technology for four common neurodegenerative diseases
- Challenges with respect to clinical application and disease modeling are discussed
- Progress towards developing cellular therapies for ALS, PD, AD and MS is summarized
