This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Derivation of the conditions and the constraints on the Post-Nonlinear (PNL) model for Second-Order Statistics (SOS)-based separation.
- Proposition of an SOS-based method for separation using a time-extended formulation.
- Formulation considers the analytical computation of the time-extended covariance matrices.
- Promising perspectives for the extension to any polynomial mixing functions in the PNL model.
