This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Experimental Hematology : Ms. No. 15- 33

Advances in Umbilical Cord Blood Stem Cell Expansion and Clinical Translation

Highlights

- Describe principal strategies developed for expansion of human stem and progenitor cells
- Review the engraftment properties of expanded progenitors obtained from preclinical studies
- Define molecules that promote stem cell engraftment through improved homing
- Review recent clinical trials conducted with ex vivo expanded cord blood stem and progenitor cells
