This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We describe application of conformal prediction to matrix factorization to provide confidence values to each of the predictions made by the matrix factorization algorithm.
- We propose four different ways of applying conformal prediction to matrix factorization.
- We define different nonconformity measures suitable to matrix factorization.
- We experimentally proved the best nonconformity measure among the proposed nonconformity measures.
- We empirically demonstrate validity and efficiency of our CP algorithm and why our proposed algorithm failed in producing the tight prediction regions at higher confidence levels.
- We experimentally demonstrate the best approach between TCP and ICP for matrix factorization problem.
- We also compare execution time of the proposed methods with matrix factorization.
