Realizability improvements to a hybrid mixture-bubble model for simulation of cavitating flows

Ebrahim Ghahramani, Mohammad Hossein Arabnejad,
Rickard E. Bensow

PII: S0045-7930(18)30346-3
DOI: [10.1016/j.compfluid.2018.06.025](https://doi.org/10.1016/j.compfluid.2018.06.025)
Reference: CAF 3945

To appear in: *Computers and Fluids*

Received date: 20 February 2018
Revised date: 21 June 2018
Accepted date: 25 June 2018

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- The hybrid model is capable of resolving various cavities in different length scales
- The new improvements avoid spurious pressure pulses and spurious vapour generation
- Consideration of bubble contribution in the Eulerian equations and mixture properties
- Better representation of the spatial distribution of Eulerian cavity after transition
