This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

RUNNING HEAD: REWARD POSITIVITY AND ALCOHOL USE HISTORY

A Preliminary Examination of the Relation between Neural Sensitivity to Reward and History of Alcohol Use Disorder among Adults with Internalizing Psychopathologies

Highlights

- Findings of an attenuated reward positivity in internalizing disorders are supported.
- IP adults exhibited a blunted reward positivity, relative to healthy controls (HCs).
- The reward positivity was increased in IP + Past AUD adults.
- Subgroups of internalizing disorders may exhibit differential reward reactivity.
