This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We identified two families with the same mutation in the *DNM2* gene.
- They had slightly different clinical presentation but similar histological features.
- We describe a new variant of 'necklace fibres' by histology and 3D EM.
- Structural features are discussed in the context of the relevant literature.
