This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

ACCEPTED MANUSCRIPT

Highlights

- First hybrid Deep Learning approach applied to environmental and on-body sensor data.
- Deep-learning is effective in human emotion classification.
- Multi-model data fusion approach performs better than single modality classification.
- Hybrid approach with combined CNN and LSTM exceed the performance of CNN alone.
