This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Reports of problems with memory or other mental abilities are associated with poorer total and work-related quality of life in bariatric surgery candidates
- Poorer performance on tests of executive function are associated with lower work-related quality of life in this population and might be an important target for intervention to improve outcomes
