This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

## Highlights

- When all treatment arms are aggregated, no significant gender differences are found
- Controlling for gender of the counterpart does not affect the results
- When priming there is suggestive evidence of gender differences in altruism
- Post-hoc analysis suggests that the priming effect only occurs in mixed-gender contexts
- More studies on gender differences in altruism in representative samples are needed
