Running head: PTSD SYMPTOM CLUSTERS AND SUICIDAL IDEATION

#### **HIGHLIGHTS**

- Suicidal ideation (SI) was positively correlated with all PTSD factors in both studies.
- Negative mood/cognitions and arousal symptom clusters were more strongly correlated with SI than other clusters in Study 1
- PTSD symptom clusters contribute to SI in community and treatment-seeking samples.
- Findings suggest a need to assess SI when PTSD cluster scores are elevated.
- Interventions may benefit from targeting NACM and AAR symptom severity.
