This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights:

- Children with ADHD with tic disorder showed increased levels of persistence and self-directedness compared to children with ADHD without tic disorder.
- Temperamental and character profiles (novelty seeking, persistence, and self-directedness) were useful for discriminating children with ADHD from the controls.
- Temperament and character profiles (persistence, self-directedness) that discriminate children with ADHD according to comorbid tic disorder was relatively low.
