This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlight

- This paper reported PTSD was a mediator in the relationship of earthquake-related exposure and quality of life among adolescents survived from Wenchuan earthquake.
- The trauma of Wenchuan earthquake is associated with multidimensional impairment in long-term quality of life among senior high school students.
- Age and female is associated with an increased risk on quality of life.
- Our findings suggested that the early intervention of PTSD in adolescents is a practicable way to improve long-term quality of life.
