This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

## Highlights:

- Those with the Broad Autism Phenotype (BAP) demonstrate similar performance on the Delis-Kaplan Executive Function System Verbal Fluency Test compared to those without the BAP.
- Weaknesses in self-reported pragmatic language in the BAP are not accounted for by weaknesses in skills underlying verbal fluency performance.
- Verbal fluency abilities are conceptually similar in those with and without the BAP.
