6 **Abstract**

7 A novel analytical model has been developed to predict the mean crushing force of square
8 carbon fibre reinforced plastic (CFRP) tubes subjected to axial crushing. The model has
9 captured the experimentally observed major energy dissipating mechanisms of CFRP tubes
10 under axial compression, i.e. crack propagation, transverse shearing and friction. Transverse
11 shearing has been taken into account for the first time in this model. Quasi-static compressive
12 tests have been conducted on 16 square CFRP tubes with various side lengths and wall
13 thicknesses to determine their mean crushing forces. The discrepancy between analytically
14 predicted and experimentally measured mean crushing forces of these square CFRP tubes is
15 no more than 7%. Moreover, the proposed analytical model is very simple with only several
16 parameters, which can be determined via relatively simple experimental tests.

17 **Keywords**

18 CFRP tube; Analytical model; Energy absorption; Axial crushing; Mean crushing force.

19 **1. Introduction**

20 Thin-walled tubular structures have been extensively employed as energy absorbers in
21 many applications such as vehicle crash boxes, bumper beams and anti-intrusion beams.
22 Nowadays, composite materials have been widely used in luxury cars. One promising
