A Discrete Time West Nile Virus Transmission Model with Optimal
Bird- and Vector-Specific Controls

Tufail Malik

PII: S0025-5564(17)30593-X

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A discrete time model for the transmission dynamics of West Nile virus (WNV) between two bird populations through vectors is presented.
- The model is a refinement of an earlier continuous time WNV model; the refinement follows Lewis et al. (2006).
- The model construction considers the ordering of events and the parameters represent probabilities.
- Optimal control theory is applied to this discrete time model.
- An optimal combination of bird-specific and vector-specific controls is characterized.
- Cost-effectiveness of various control strategies is compared.
