This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

ACCEPTED MANUSCRIPT

Highlights

- We propose a clustering procedure in order to partition a risk portfolio into independent subgroups of positively dependent risks
- The portfolio partition so obtained can be statistically validated and allows for a reduction of capital and the corresponding model uncertainty
- We propose a rule of thumb for risk aggregation in the presence of finite and infinite-mean marginal models
