Delineation of subsurface variability in clay-rich landslides through spectral induced polarization imaging and low induction number electromagnetic methods

Jakob Gallistl, Maximilian Weigand, Margherita Stumvoll, David Ottowitz, Thomas Glade, Adrian Flores Orozco

PII: S0013-7952(17)31891-4
DOI: doi:[10.1016/j.enggeo.2018.09.001](https://doi.org/10.1016/j.enggeo.2018.09.001)
Reference: ENGEO 4927
To appear in: *Engineering Geology*
Received date: 30 December 2017
Revised date: 14 June 2018
Accepted date: 1 September 2018

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Delineation of subsurface variability in clay-rich landslides through spectral induced polarization imaging and low induction number electromagnetic methods

Jakob Gallistl^{1*}, Maximilian Weigand², Margherita Stumvoll³, David Ottowitz⁴, Thomas Glade³, and Adrian Flores Orozco¹
