Abstract

In this paper, a system of Hardy-type critical elliptic equations is studied, asymptotic properties at the origin of positive solutions are proved by the Moser iteration method and an open problem proposed in [1] is solved.

Keywords: system of elliptic equations; solution; asymptotic property; variational method.

Mathematics Subject Classification 2000: 35J47, 35J60

1 Introduction

In this paper, we study the following elliptic system:

$$\begin{cases} -\Delta u - \mu_1 \frac{u}{|x|^{2^*}} = |x|^{2^*-1} + \frac{\eta}{2^*} u^{\alpha-1} v^\beta + a_1 u + a_2 v & \text{in } \Omega, \\ -\Delta v - \mu_2 \frac{v}{|x|^{2^*}} = |x|^{2^*-1} + \frac{\eta\beta}{2^*} u^\alpha v^{\beta-1} + a_2 u + a_3 v & \text{in } \Omega, \\ u, v > 0 \text{ in } \Omega \setminus \{0\}, \quad u = v = 0 \text{ on } \partial\Omega, \end{cases} \quad (1.1)$$

where $\Omega \subset \mathbb{R}^N (N \geq 3)$ is a bounded domain with smooth boundary such that $0 \in \Omega$ and the parameters satisfy the following assumption:

$$\begin{aligned} (\mathcal{H}_1) \quad & N \geq 3, \quad \mu_1 > 0, \quad 0 \leq \mu_2 \leq \mu_1 < \bar{\mu} := \left(\frac{N-2}{2}\right)^2, \quad a_i \geq 0, \quad i = 1, 2, 3, \\ & \alpha > 1, \quad \beta > 1, \quad \alpha + \beta = 2^* := \frac{2N}{N-2}. \end{aligned}$$

Let $H := H_0^1(\Omega)$ be the completion of $C_0^\infty(\Omega)$ with respect to $(\int_\Omega |\nabla \cdot|^2 dx)^{1/2}$. The functional corresponding to (1.1) is defined on $H \times H$ by

$$\begin{aligned} J(u, v) := & \frac{1}{2} \int_\Omega (|\nabla u|^2 + |\nabla v|^2 - \frac{\mu_1 u^2 + \mu_2 v^2}{|x|^{2^*}} - (a_1 u^2 + 2a_2 uv + a_3 v^2)) dx \\ & - \frac{1}{2^*} \int_\Omega (|u|^{2^*} + |v|^{2^*} + \eta |u|^\alpha |v|^\beta) dx. \end{aligned}$$
