Keywords: Benzylamine Antagonist Agonist Protease activated receptor 2 (PAR2) Inflammation

## ABSTRACT

Activation of protease activated receptor 2 (PAR2) has been implicated in inflammatory and metabolic disorders and its inhibition may yield novel therapeutics. Here, we report a series of PAR2 antagonists based on C-terminal capping of 5-isoxazolyl-L-cyclohexylalanine-L-isoleucine, with benzylamine analogues being effective new PAR2 antagonists. 5-Isoxazolyl-L-cyclohexylalanine-L-isoleucine-2-methoxy-benzylamine (**10**) inhibited PAR2-, but not PAR1-, induced release of  $Ca^{2+}$  (IC<sub>50</sub> 0.5  $\mu$ M) in human colon cells, IL-6 and TNF $\alpha$  secretion (IC<sub>50</sub> 1–5  $\mu$ M) from human kidney cells, and was anti-inflammatory in acute rat paw inflammation (ED<sub>50</sub> 5 mg/kg sc). These findings show that new benzylamide antagonists of PAR2 have anti-inflammatory activity.

Protease activated receptor 2 (PAR2) was the second member discovered of the protease activated receptors, a unique group of class A G protein coupled receptors.<sup>1–4</sup> PAR2 is expressed in immune and inflammatory cells including T-cells, monocytes, macrophages as well as in many types of cancer cells.<sup>3–6</sup> There has been some controversy about PAR2 activation being proand/or anti-inflammatory.<sup>4,7</sup> However PAR2 activation is clearly associated with inflammatory diseases such as arthritis<sup>8,9</sup> and inflammatory bowel disease, <sup>10–12</sup> stimulating growth and invasion of pro-inflammatory and cancer cells, producing TNF-α and IL-6, and inducing joint swelling, mechanical and thermal hyper-algesia.<sup>9,13,14</sup> Effective PAR2 antagonists could be beneficial for probing PAR2 function in vivo and for treating disease.

GPCR antagonists have often been derived from their corresponding endogenous agonists through minor changes.<sup>15,16</sup> 2f-LIGRLO-NH<sub>2</sub> (**1**) and GB110 (**2**) have been reported as equipotent PAR2 agonists (Fig. 1),<sup>16,17</sup> for example, in activating human colon adenocarcinoma (HT29) cells to release intracellular calcium (iCa<sup>2+</sup>, EC<sub>50</sub> 0.2  $\mu$ M).<sup>16</sup> Compound **1** is unstable in vivo due to proteolysis, but the non-peptidic agonist **2** is a promising template for elaborating to a plasma stable PAR2 antagonist. We previously reported that replacement of the C-terminal primary amine in **2** 

with a morpholine group produced a weak antagonist (**3**,  $IC_{50}$  57 µM,  $iCa^{2+}$ , HT29 cells, Fig. 1).<sup>16</sup>

Structure–activity relationship (SAR) studies on the PAR2 antagonist GB88 (**4**) suggested that the isoxazolyl, cyclohexyl-alanine and isoleucine residues were intolerant of other substitution for antagonist potency (unpublished results). Our PAR2 homology model (derived from ORL-1 receptor crystal structure 4EA3)<sup>18</sup> also suggested that the C-terminal spiro[indene-1,4'-piperidine] ring of **4** may be involved in a  $\pi$ -stacking interaction with the receptor in a hydrophobic pocket created by Y156<sup>3.33</sup> and F300<sup>6.48</sup>. As the structures of **2** and **4** are similar, it is possible that the phenyl ring of **2** binds to the same hydrophobic pocket as the spiroindene phenyl ring of **4**. Furthermore, the benzylamine core of **2** replaces the piperidine of **4**, while presenting a phenyl ring closer to the amide linker than in **4**. The ready availability of benzylamine derivatives provided easy access to a focused library around the common core of **2–4**.

Truncation of agonist **2** by removing the piperidine methylamine gave the parent benzylamine derivative **5** (Table 1). Diverse functional groups were attached to the benzyl ring with varying electronic and steric properties. The benzylamine/alkylamine templates were either commercially available or synthesized in-house. The antagonist/agonist potency of all compounds on HT29 cells was assessed using an intracellular calcium (iCa<sup>2+</sup>) mobilization assay. Compounds that showed agonist activity ~50% or less at 10  $\mu$ M were screened for potential antagonist activity. Compound
