#### ABSTRACT

This data article presents the differences observed between the myristoylated and non-myristoylated forms of the neuronal calcium sensor protein, neurocalcin delta (NCALD). Analysis of the myristoylated and non-myristoylated versions of the protein by mass spectrometry provided difference in mass values consistent with addition of myristoyl group. In the presence of calcium, mobility retardation was observed upon electrophoresis of the protein in native gels. The retardation was dose-dependent and was exhibited by both the myristoylated and non-myristoylated forms of the protein.

How data was acquired	Mass spectroscopy: Bruker Microflex LRF MALDI-TOF	
	Electrophoresis: Bio-Rad miniPROTEAN	
Data format	Analyzed	
Experimental factors	For mass spectrometry, the samples were co-crystallized in 1:1 mixture of sinapinic acid and matrix solution containing acetonitrile, water and trifluoroacetic acid. For electrophoresis, standard protocols were used.	
Experimental features Data source location Data accessibility	Myristoylated and non-myristoylated forms of NCALD were analyzed Stratford, NJ 08012, USA Data is within this article	

### Value of the data

- The relevance of myristoylation to the biological functions of Neuronal Calcium Sensor (NCS) proteins remains to be elucidated.
- Data is presented on the myristoylated and non-myristoylated forms of NCALD assessed by calciuminduced mobility shift assay.
- The calcium-induced mobility shift assay may be useful in assessing the contribution of myristoylation and other post-translational modifications to response of all NCS proteins to calcium.

## 1. Data

Bacterially expressed NCALD was purified in its myristoylated and non-myristoylated forms independently. Mass spectrometric analyses was carried out to determine the mass of each form and to determine if the myristoylated form also contained the non-myristoylated form. A table of the mass values of the two forms is provided, along with those documented in an earlier report by other investigators. Based on the analyses, there is little non-myristoylated NCALD in the myristoylated preparations. The two preparations were subjected to electrophoresis in native gels in the presence of incremental concentrations of calcium. A dose-dependent mobility retardation is observed with both forms. However, the myristoylated form exhibits a greater amplitude and increased sensitivity to change in calcium concentrations.

### 2. Experimental design, materials and methods

NCALD was expressed in *E. coli* ER2566 as described in [1]. Briefly, cells grown overnight were inoculated (1% inoculum) into fresh LB medium and grown to an optical density of 0.6 at 600 nm. IPTG (1 mM final concentration) was then added for induction. For myristoylation, cells with yeast *N*-Myristoyl Transferase were used and myristic acid was supplemented. Cells without the transferase were used to generate the non-myristoylated form; the supplementation was also skipped. Cells were collected 2.5 h after induction, sonicated and the protein was purified on phenyl sepharose columns as described previously [2,3]. The purified protein was then washed with calcium-depleted Tris–Cl

Table 1Mass Spectrometric Analyses of NCALD.

Description	Myr <sup>-</sup> Neurocalcin	Myr <sup>+</sup> Neurocalcin
Molar mass (g mol <sup>-1</sup> $\pm$ SD) (MALDI-MS)	$22,\!107.1 \pm 0.8$	$\textbf{22,325.8} \pm \textbf{1.4}$
Previously reported molar mass (g mol <sup>-1</sup> $\pm$ SD) (ESI-MS)	$\textbf{22,110} \pm \textbf{2}$	$\textbf{22,325} \pm \textbf{2}$
