Essential oil;
Chemical composition;
Insecticidal activity

Abstract In the search for alternatives to conventional insecticides, essential oils extracted from aromatic plants have been widely investigated. Their toxicities toward insects were of special interest during the last decade. The purpose of this paper is to provide an overview of the data published mostly in the past 10 years on aromatic plant and plant's essential oils that have been reported to possess insecticidal activity and practical methods and recent techniques for screening these compounds. The review refers to 230 plants, their geographical distribution and the organism tested. Some aspects of recent insecticidal activity directed research on natural products are discussed.

1. Introduction

Chemical control is an effective strategy used extensively in daily life (Pavela, 2009a). However, the widespread use of synthetic insecticides has led to many negative consequences (Pavela, 2008), resulting in increasing attention to natural products (Pirali-Kheirabadi and da Silva, 2010). Among bio-

pesticides, botanical ones are experiencing a revival due to their eco-toxicological properties (Cosimi et al., 2009). Plants play pivotal roles in ecological systems (Garcia et al., 2007). They may provide potential alternatives to currently used insect-control agents because they constitute a rich source of bioactive chemicals (Qin et al., 2010). Essential oils are among the best-known substances tested against insects (Pitasawat et al., 2007). These compounds act as fumigants (Choi et al., 2006), contact insecticides (Tang et al., 2007), repellents (Islam et al., 2009) and antifeedants (Gonzalez-Coloma et al., 2006) and may affect some biological parameters such as growth rate (Nathan et al., 2008), life span and reproduction (Isikber et al., 2006).

Risks and problems associated with the use of chemicals lead to increasingly stringent environmental regulation of pesticides (Pavela et al., 2010). There is therefore an urgent need to develop safer, more environmentally friendly and efficient alternatives that have the potential to replace synthetic pesti-
