Abstract

In vivo imaging of tau deposits is providing a better understanding of the temporal and spatial tau deposition in the brain, allowing a more comprehensive insight into the causes, diagnoses, and potentially treatment of tauopathies such as Alzheimer's disease, progressive supranuclear palsy, corticobasal syndrome, chronic traumatic encephalopathy, and some variants of frontotemporal lobar degeneration. The assessment of tau deposition in the brain over time will allow a deeper understanding of the relationship between tau and other variables such as cognition, genotype, and neurodegeneration, as well as assessing the role tau plays in ageing. Preliminary human studies suggest that tau imaging could also be used as a diagnostic, prognostic, and theranostic biomarker, as well as a surrogate marker for target engagement, patient recruitment, and efficacy monitoring for disease-specific therapeutic trials.

Acknowledgments

We thank Professors Yukitsuda Kudo, Colin Masters, Kazuhiko Yanai, Shozo Furumoto, Drs Ryuichi Harada, Michelle Fodero-Tavoletti, William P. Blatty, Mrs Svetlana Pejoska-Bozinovski, Ms Fiona Lamb, and the Brain Research Institute for their assistance with this study. This review was supported in part by NHMRC Project Grant 1044361. VLV is supported by NHMRC Research Fellowship 1046471. The funding sources had no input into the design of this study, the analysis of data, or writing of the manuscript.

V.L.V. has received speaker honoraria from GE Healthcare, Piramal Imaging, and Avid Radiopharmaceuticals and consulting honoraria from Novartis and Lundbeck. N.O. has received research support from Clino Co. Ltd. THK compounds have been licensed to GE Healthcare. C.C.R. has received speaker honoraria from received speaker and consulting honoraria

from GE Healthcare, Piramal Imaging, Avid Radiopharmaceuticals, Navidea, and AstraZeneca.
