Abstract

We herein report on a patient undergoing hemodialysis who developed various neuropsychiatric symptoms. The patient was a 62-year-old woman who began hemodialysis treatment for chronic kidney failure caused by chronic glomerulonephritis at 40 years of age. At 60 years of age, she began to show depressive symptoms such as insomnia, loss of appetite, and loss of motivation. About 1 month later, she became disorientated and often talked to herself or others in a rambling way, although her renal
