On the cover: A 74-year-old man with a history of prostate cancer treated with external beam radiation therapy (EBRT) 6 years ago presented to the emergency department with a several-weeks-long history of progressively worsening lower back pain. His neurological evaluation was unremarkable but computed tomographic scan of his lumbar spine disclosed diffuse marrow replacement and a partial compression fracture of the L1 vertebral body consistent with metastatic disease. The patient was admitted to the hospital for further evaluation and treatment with the presumptive diagnosis of metastatic prostate cancer.
