Preprojective algebras

ABSTRACT

In this note we consider a notion of relative Frobenius pairs of commutative rings S/R . To such a pair, we associate an $\mathbb{N}$ -graded R -algebra $\Pi_R(S)$ which has a simple description and coincides with the preprojective algebra of a quiver with a single central node and several outgoing edges in the split case. If the rank of S over R is 4 and R is Noetherian, we prove that $\Pi_R(S)$ is itself Noetherian and finite over its center and that each $\Pi_R(S)_d$ is finitely generated projective. We also prove that $\Pi_R(S)$ is of finite global dimension if R and S are regular.

1. Introduction

1.1. Definitions

For the purposes of this paper, we consider pairs of commutative rings R, S equipped with a map $R \rightarrow S$. We often write such a pair as S/R . We will always assume R is Noetherian, although some of the results also hold in greater generality.

Definition 1.1. We say that S/R is relative Frobenius of rank n if:

- S is a free R -module of rank n .
- $\mathrm{Hom}_R(S, R)$ is isomorphic to S as S -module.

Remark 1.2.

- It is clear that if R is a field, a relative Frobenius pair coincides with a finite dimensional Frobenius algebra in the classical sense.
- Let $e_1, \dots, e_n$ be any basis for S as an R -module. Then the second condition is equivalent to the existence of a $\lambda \in \mathrm{Hom}_R(S, R)$ such that the R -matrix $(\lambda(e_i e_j))_{i,j}$ is invertible.
- We may equally well assume that S/R is projective of rank n . However all results we prove may be reduced to the free case by suitably localizing R .

We shall need the following notation: for a relative Frobenius pair S/R , let $M := {}_R S_S$. This R - S -bimodule can be viewed as an $R \oplus S$ bimodule by letting the R -component act on the left and the S -component on the right, the other actions being trivial. Similarly, we let $N := {}_S R_R$ and view it as an $R \oplus S$ -bimodule by only letting the S -component act on the left and the R -component act on the right, the other actions again being trivial. We now define

$$T(R, S) := T_{R \oplus S}(M \oplus N)$$

Note that by construction, we have $M \otimes_{R \oplus S} M = N \otimes_{R \oplus S} N = 0$, hence

$$T(R, S)_2 = (M_{R \oplus S} N) \oplus (N \otimes_{R \oplus S} M) = ({}_R S \otimes_S {}_S R) \oplus ({}_S R \otimes_R {}_R S)$$
