This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

## Graphical Abstract

**Lamellar morphology of D3****D3 with extended light absorption**

F<sup>-</sup> and I<sup>-</sup> dual halide anions doped bismuth terephthalate (D3) was found as a promising metal-organic frameworks material for visible light photodegradation of organic pollutants.
