Keywords: Shading effect Wireless sensor network ZigBee Solar photovoltaic AVR microcontroller Dust effect

### ABSTRACT

The environmental and economic merits of converting solar energy into electricity via photovoltaic cells have led to its enormous growth in this sector. Besides material and design parameters, there are many other factors which locally affect Photovoltaic cell like partial shading, humidity, dust, bird droppings, air velocity etc. However, the effect due to a single solar photo voltaic cell being connected to a serial or parallel network (to form a grid) has never been deliberated extensively. In this paper a system design that will detect the underperforming panel in the entire grid is proposed and validated. All the Photo voltaic panels in a grid are connected with current sensors, which are connected to microcontrollers and these microcontrollers are locally connected with the wireless sensor network. With the help of wireless sensor network, grid monitoring for individual panel has been achieved for the first time with proposed system. The grid and control room is also connected wirelessly which enables the engineer monitoring the grid to meticulously locate the individual solar photovoltaic cell which is underachieving and solve the issue pertaining the same. The proposed system design has been validated with the help of data obtained with Centre for Wind Energy Technology (CWET), Govt. of India.".

## 1. Introduction

Rapid fossil fuel consumption and the green house effect have prompted the world to devote considerable resources for the research and development [29] [40]; of Solar Photo Voltaic (SPV) generation systems as solar energy is free, inconsumable and clean source of energy. The Solar energy received by the Earth is 15000 times more than the World's commercial energy consumption [18]. Developing countries like India is getting 5000 trillion kWh per year energy incident over its land area, with most parts of the country receiving 4–7 kWh per m<sup>2</sup> per day [32]. In most part of India, clear sunny day is experienced for 250–300 days a year [33] and the annual radiation varies with 1600–2200 kWh/m<sup>2</sup> [33].

Peer review under responsibility of Karabuk University.

For remote electrical power supply, stand-alone photovoltaic systems are developed [7,9]. Evolution of SPV array is leading to the design and installation of large sized PV plants. The structure of the SPV plant is governed by suitable parallel and series connections of the SPV cells [10,17], in this way it forms a grid connected photovoltaic systems [24].

The panel monitoring and control is the most important part of such systems. Lot of research is going on improving the efficiency of SPV's and large amount of money is invested by various governments to achieve so [39].

For any SPV, output characteristic depends on the environmental conditions. The output power is function of the temperature and the irradiance values of the site where panel is placed. This power varies as a result of any temperature and/or shining variations. However, performance analysis of this scheme in real conditions is generally a difficult task because several factors like ground clearance of SPV panels, soil (sandy, dusty, metallic rich etc.) condition of the surrounding area/soil particle size etc. are acting on it.

If any of the panel in the grid is not working then the entire grid's performance gets degraded and it is very difficult to locate

#### Table 1

Summary of selected reported dust effects on solar photovoltaic (SPV) device performances for the period of 1942 to the present.

| Reference   | Location               | Type of solar device                    | Period of study   | Key findings  | Comments and conditions   |
|---|------------------------|---|-------------------|---|---|
| Hottel and Woertz [20]                                  | Boston, MA, USA        | Solar-thermal collectors                | 3 months          | Maximum degradation during the test period was 4.7%   | A correction factor of 0.99 (for a 45" tilt angle)  |
| Dietz [11]  | NY, USA                | Glass samples                           | 3 months          | At tilt angles between 0" and 50", the reduction in solar radiation due to dirt was 5%  |   |
| Sayigh [43]   | Saudi Arabia           | Solar collectors                        | 25 days           | Heat-collection reduction of 30% after 3 days<br>without wiping   |   |
| Anagnostou and<br>Forrestieri [6]                       | Cleveland, OH, USA     | PV modules                              | 1 year -          | Degradation is site dependent Washing does<br>not eliminate all degradation Permanent loss<br>in maximum power reaches a steady value after<br>several hundred days   | Local condition is most<br>damaging   |
| Murphy and<br>Forman [35];<br><b>Forman</b> [15]        | Lexington, MA, USA     | PV module (glass)                       | 18 months         | Measurement of soil accumulation and model<br>Cleaning using gloss meter  |   |
| Nimmo, Saed [36]  | Saudi Arabia           | Solar collectors& PV<br>modules (glass) | 6 months          | 26% and 40% reduction of efficiency from solar collector and PV panels, respectively  | Dry conditions  |
| Wakim [47]<br>El-Shobokshy et al. [13]<br>;Zakzouk [49] | Kuwait<br>Saudi Arabia | PV modules (glass)<br>CPV               | 6 days<br>1 month | 17% reduction in efficiency of module<br>Open-circuit voltage did not change, and short-<br>circuit current and cell efficiency showed a large<br>change with dust deposition   | Concentrating PV study; effect<br>on dust accumulation on cell<br>temperature investigated;<br>Modeling of series resistance<br>effects |
| Bajpai and Gupta [8]                                    | Nigeria                | Silicon solar cell                      | 4 months          | Poor efficiency due to scattering of incoming<br>radiation by dust particles  |   |
| Ryan et al. [41]  | Oregon, USA            | Solar module array (glass)              | 6 years           | Unwashed solar cell array has degraded at a rate about 1.4% per year  | Fluctuations in degradation<br>(rates) do exist and long-term<br>testing of degradation is needed                                       |
| Said [42]   | Saudi Arabia           | Solar collectors& PV<br>modules (glass) | 1 year            | 7% reduction per month for PV panels and 2.8% to 7% for solar collectors  |   |
| Pande [37]  | India                  | PV module (glass)                       | 1 year            | Reduction in current value due to dust was up to 30%  |   |
| Alamoud [4]   | Riyadh, Saudi Arabia   | PV module (glass)                       | 1 year            | Efficiency decreased by 5.73%–19.8% depending<br>on the type of the module when exposed to<br>outside environment   | Compared module<br>specifications to manufacturer's<br>claims (differences). Hot, arid<br>conditions                                    |
| Adanu [2]   | Ghana                  | PV system (glass)                       | 4 years           | Effect of dust particles in atmosphere generally<br>reduces the solar irradiance and the energy<br>output from the PV array   | Time of day data reported.<br>Cleaning by wiping of module<br>surface   |
| Kattakayam et al. [25]                                  | India                  | PV module (glass)                       | Laboratory work   | The loss of power due to accumulation of dust<br>and the increase in temperature of the panel<br>can be significant   | Careful analysis of IV<br>characteristic from operating<br>PV field. Provides information<br>on instrumentation for<br>monitoring       |
| Goossens,<br>Van Kerschaever [16]                       | Israel                 | PV modules (glass)                      | Laboratory work   | Fine dust deposition on the cell has significant<br>effect on power output. Considered effects of<br>due to air borne dust concentration and wind<br>velocity. Reported losses in solar intensity on<br>cells, open-circuit voltage, fill factor, short-<br>circuit current and power as function of<br>accumulation time. Power losses greater than<br>95% | Reported I–V characteristics as<br>a function of the dust density   |
| Hassan et al. [3]                                       | Saudi Arabia           | PV modules (glass)                      | 6 months          | 33.5% and 65.8% reductions in efficiency after 1<br>month and 6 months.   |   |
